## Attachment 2

## System Capabilities and Characteristics Parameters

A1.1.1 Integration (Wear/Fit/Comfort)  A1.1.2. Wear Duration Protection Protection Protection A1.1.4 Thermal Protection A1.1.1.5. Noise Attenuation A1.1.1.2 Wear Datable of being safely and efficiently operated by aircrew members from JPATS cases 1-6, and pilot nude weight range of 103-245 lbs.  The T-38 cockpits (forward and aft), including the escape system, must be capable of being safely and efficiently operated by aircrew members from JPATS cases 1-6, and pilot nude weight range of 103-245 lbs should be accommodated as a goal. The escape system and interfaces must functionally and physically integrate with existing life support equipment as identified in the table in paragraph 4.1.1, and as worn by the defined population.  Attenuation			
must be capable of being safely and efficiently operated by aircrew members from JPATS cases 1-6, and pilot nude weight range of 103-245 lbs.  Equipment must be designed and developed to support individual fit and comfort throughout maximum wear/flight duration of 2.0 hours.  System/components must allow users to safely operate at altitudes from sea level to 50,000 ft for the duration specified in paragraph 4.1.1.10.  Systems/components must provide protection against thermal energy exposure as a result of an ejection, or canopy jettison. Crew member exposure to thermal energy as a result of escape system utilization by either of the aircraft occupants or rescue personnel shall not exceed a burn depth of 100 microns.  During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	System Capabilities and Characteristics Parameters	Thresholds	Objectives
Equipment must be designed and developed to support individual fit and comfort throughout maximum wear/flight duration of 2.0 hours.  System/components must allow users to safely operate at altitudes from sea level to 50,000 ft for the duration specified in paragraph 4.1.1.10.  Systems/components must provide protection against thermal energy exposure as a result of an ejection, or canopy jettison.  Crew member exposure to thermal energy as a result of escape system utilization by either of the aircraft occupants or rescue personnel shall not exceed a burn depth of 100 microns.  During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	4.1.1. Integration (Wear/Fit/Comfort)	The T-38 cockpits (forward and aft), including the escape system, must be capable of being safely and efficiently operated by aircrew members from JPATS cases 1-6, and pilot nude weight range of 103-245 lbs.	JPATS cases 1-7 and pilot nude weight range of 103-245 lbs should be accommodated as a goal. The escape system and interfaces must functionally and physically integrate with existing life support equipment as identified in the table in paragraph 4.1.1, and as worn by the defined population.
System/components must allow users to safely operate at altitudes from sea level to 50,000 ft for the duration specified in paragraph 4.1.1.10.  Systems/components must provide protection against thermal energy exposure as a result of an ejection, or canopy jettison.  Crew member exposure to thermal energy as a result of escape system utilization by either of the aircraft occupants or rescue personnel shall not exceed a burn depth of 100 microns.  During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	4.1.1.2. Wear Duration	Equipment must be designed and developed to support individual fit and comfort throughout maximum wear/flight duration of 2.0 hours.	N/A
Systems/components must provide protection against thermal energy exposure as a result of an ejection, or canopy jettison.  Crew member exposure to thermal energy as a result of escape system utilization by either of the aircraft occupants or rescue personnel shall not exceed a burn depth of 100 microns.  During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	4.1.1.3. Altitude Protection	System/components must allow users to safely operate at altitudes from sea level to 50,000 ft for the duration specified in paragraph 4.1.1.10.	N/A
During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	4.1.1.4 Thermal Protection	Systems/components must provide protection against thermal energy exposure as a result of an ejection, or canopy jettison. Crew member exposure to thermal energy as a result of escape system utilization by either of the aircraft occupants or rescue personnel shall not exceed a burn depth of 100 microns.	N/A
	4.1.1.5. Noise Attenuation	During both normal and ejection conditions, the escape system must not contribute to a cumulative noise exposure that exceeds safe occupational limits.	N/A

N/A	System/components must protect against all possible pressure	4.1.1.6. Decompression

4.1.1.11. Acceleration Protection	Systems/components must provide protection to the user for acceleration rates during the ejection process. Accelerations should be limited to provide functional escape for ejection airspeeds of 550 KEAS.	Accelerations and head and neck loads experienced during ejection must be controlled and limited to minimize risk of personal injury.
4.1.1.12.1. Basic Protection	System/components must shield the eyes from adverse effects of solar radiation, windblast, airborne debris during	Should changes be required to current, off- the-shelf military specification hardware, the
	bailout/emergency ejection, and protect eyes during missions/ground operations where facial cover is required; i.e.,	replacements must meet applicable military specifications and be capable of supporting
	takeoff/landing, airborne/airlift, rescue/recovery missions, etc.  Design solutions must account for use of corrective lenses and	both clear and neutral density, 30% transmittance eye protection for day and

	ejection speed capability must be 550 KEAS, with a goal to permit functional ejection up to 600 KEAS. The escape system will	limited to seat accelerometers, seat pan accelerations, seat back accelerations, and
	incorporate a seat mounted parachute system and an interseat	seat cushion accelerations.
	to eject with the pulling of a single ejection handle and will	
	optimized for performance in aircraft out of control ejections,	
	aircraft flight traffic pattern altitudes/airspeeds/configurations, and	
	possible before seat/man separation.	

4.1.1.13. Ejection	The maximum functional ejection speed capability must be 550 KEAS,	with a goal to permit functional ejection up to 600 KEAS
4.1.1.15. Restraint/ Deceleration/Descent	The escape system must provide active restraint for the occupant's legs. System shall successfully protect both arms (desired) and both legs (required) for the ejection sequence up to seat/man separation for the full performance envelope of the ejection system. System shall integrate with the operation of the aircraft without human performance degradation and shall be capable of retrieving limbs from all normal limb positions during aircraft operations. Provisions shall be incorporated for seat and crewmember stability during free flight, including the period from rocket ignition through recovery parachute deployment.	N/A
4.2.1. System Inspection	Inspection intervals on current use equipment vary based on use,	System equipment/components should be
Interval	storage, packing methods, etc. In no circumstances will inspection intervals be less than current use equipment; e.g.,	designed/tested to extend inspection intervals so as to reduce hands-on maintenance,
	oxygen mask - 30 day interval, ejection seat survival kits - 120 day interval, ejection seat phase inspections – 2 years, parachute repacks – 1 year.	installation, and removal from aircraft, etc.
4.2.2. Storage and Service Life	System equipment/components will have a minimum 4-year storage (shelf) life. Service (operational) life will be the	However, new technologies, materials, and nackaging methods should allow for much
	maximum possible length of time and will be at least 75 percent of shelf life (e.g. a component with a 8 year shelf life will have a minimum of 6 year service life).	higher storage and shelf lives, e.g. 5 to 10 years.
4.2.2.1. Cartridge Actuated	CAD/PAD components will have an initial storage (shelf) life of 5 years and an initial operational (service) life of 3 years.	Design life of 10 years, both shelf and service life is desirable.
